Preguntas Teóricas 1) De QDA: log f; (x) = -1/2 log [\(\xi\_j\) - \frac{1}{2} (x-\mu\_j)^T Z\_j^{-1} (x-\mu\_j) + C Para LDA: X | Q=1 ~ Np (Mj, E)  $\Rightarrow \log f_{j}(x) = -\frac{1}{2} \log |\Sigma| - \frac{1}{2} (x - \mu_{j})^{T} \Sigma^{-1} (x - \mu_{j}) + C$  $= -\frac{1}{2} \log |\Sigma| - \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \mu_j + \frac{1}{2} \mu_j \times \frac{1}{2} \times \frac{1}{2} \mu_j \times \frac{1}{2} \mu_j + C$ =  $-\frac{1}{2}\log|\Sigma| - \frac{1}{2}\chi^{T}\Sigma \chi + \mu_{j}^{T}\Sigma \chi - \frac{1}{2}\mu_{j}^{T}\Sigma \mu_{j} + C$ Son constantes para  $j \Rightarrow C = -\frac{1}{2} \log |\Sigma| - \frac{1}{2} \times \frac{1}{2} \times + C$ = 4, 2 × - 1 4, 2 / + c  $\Rightarrow \log_{1}(x) = \mu_{j} Z^{-1} \left( x - \frac{1}{2} \mu_{j} \right) + C'$
